

Exercise 1:

1. Favourite LLM Rank My favourite LLM is Gemini, which currently ranks within the top 15 on the Artificial Analysis leaderboard.

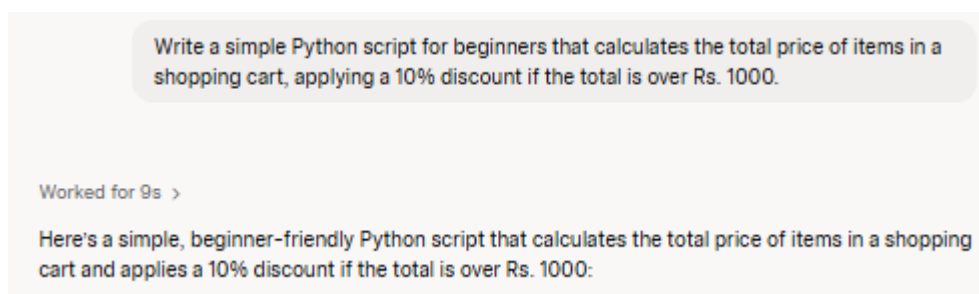

2. New Models Tried

1. Claude Opus 5
2. Grok 4.6

Model 1: Claude Opus 5

Model 2: Grok 4.6

Python

Simple Shopping Cart Calculator

```
print("Welcome to the Shopping Cart Calculator!")
print("Enter the prices of your items (in Rs.). Type 0 when finished.\n")

# List to store prices
prices = []

# Keep asking for prices until the user enters 0
while True:
    price = float(input("Enter item price (or 0 to finish): "))

    if price == 0:
        break
    elif price < 0:
        print("Price cannot be negative. Please try again.")
    else:
        prices.append(price)

# Calculate the total
total = sum(prices)

print("\n----- Bill Summary -----")
print(f"Number of items: {len(prices)}")
print(f"Subtotal: Rs. {total:.2f}")

# Apply 10% discount if total is over Rs. 1000
if total > 1000:
    discount = total * 0.10
    final_total = total - discount
    print(f"Discount (10%): Rs. {discount:.2f}")
    print(f"Final Total: Rs. {final_total:.2f}")
else:
    print("No discount applied (total is Rs. 1000 or less).")
    print(f"Final Total: Rs. {total:.2f}")

print("-----")
print("Thank you for shopping!")
```

How it works:

1. The program asks you to enter the price of each item.
2. Type  when you have finished adding items.
3. It calculates the total (subtotal).
4. If the total is **greater than Rs. 1000**, it applies a **10% discount**.
5. It shows a clear bill summary.

Example run:

text

 Copy

```
Enter item price (or 0 to finish): 450
Enter item price (or 0 to finish): 300
Enter item price (or 0 to finish): 400
Enter item price (or 0 to finish): 0
```

```
----- Bill Summary -----
Number of items: 3
Subtotal: Rs. 1150.00
Discount (10%): Rs. 115.00
Final Total: Rs. 1035.00
-----
```

You can copy this code into any Python editor (or online tools like Replit / Google Colab) and run it.
Enjoy coding!
